**Essential Hypertension** Jan 23 2022 In the span of a few short years the therapeutic management of essential hypertension has been transformed from one of gross empiricism to that of a stable, rational approach based on established pharmacological principles. This success has required a close liaison among the disciplines of chemistry, of pharmacology, and of the clinic, for the niceties and fine nuances governing the relationship between chemical structure and type of biological activity of a compound are all too elusive for charting a reliable course through unfamiliar synthetic molecular configurations. Although autonomic nervous overactivity had never been demonstrably implicated as an etiological factor in essential hypertension, it had been realized earlier that suppression of this system by pharmacological means offered potential therapeutic benefit. Unfortunately, early investigative work had not yielded specific potent autonomic blocking agents with sufficiently wide therapeutic indices to be suitable for human use. The initial successful surgical approach to the problem of sympathetic nervous dampening by means of a dorsal thoracolumbar sympathectomy established the validity of such a procedure and laid the groundwork for an ultimate pharmacological approach. Among the effective agents which have been discussed, an action either directly or indirectly upon the sympathetic nervous system or upon the neurohumors which it elaborates has been a common denominator. Such an occurrence inevitably poses the question as to whether such a common denominator has basic meaning or is merely coincidental with respect to the mode of action of the drug.

**Fundamental Fault in Hypertension** Dec 22 2021 The fundamental fault in hypertension is unknown. Calling it a fundamental fault, indeed, tacitly begs the question: Is there one fundamental fault, or are there several that are interlinked or interdependent? A simple yes or no answer cannot be offered. This volume is not designed to survey the up-to-date recent advances in research on hypertension, nor intended to provide provisional answers to the so many unknowns in this topic. It is, in fact, an attempt to articulate questions that are worth asking, given the license of an uninhibited, albeit disciplined, inquiry. The range of expression varies from dogmatic opinion to a declared speculation. Is the primary abnormality an excessive sodium and reduced potassium intake over generations? Or is it hormonal excess, deficiency, imbalance or altered synthesis of abnormal forms? Does the nervous system play a role of active initiation or only of passive maintenance in the genesis of hypertension? Is the heart only a pump acting in concert with the happenings to the vasculature trying to provide adequate flow in the face of vasoconstriction induced by neural or humoral factors, or does it sometimes become the culprit by pumping blood flow in excess of demand and thus initiating hypertrophic changes in blood vessels, or by assuming the role of an endocrine organ and being the source of a hormone with influence on cellular transport of sodium and on vasomotor

tone? Is an elusive and mysterious fault in the kidney, the primary basis of all of the above
